

Section 1:

#1 (First paragraph): a. Strengths:

- Engaging opening with vivid imagery
- Establishes a clear contrast between positive and negative environmental behaviours

b. Weaknesses: Lack of Focus Your writing meanders through various ideas without a clear central point. For instance, you begin with a description of a morning stroll, then abruptly shift to discussing littering and smoking, before concluding with a broad statement about individual actions. This lack of focus makes it challenging for the reader to grasp your main argument.

c. Exemplar: "As you take your morning stroll, you witness a stark contrast: on one side, community members diligently picking up rubbish and planting trees, while on the other, individuals carelessly littering and smoking. This juxtaposition highlights the critical role our individual actions play in sustaining a healthy planet."

#2 (Third paragraph): a. Strengths:

- Provides a specific example to support the argument
- Attempts to quantify the impact of individual actions

b. Weaknesses: Overgeneralisation Your writing makes sweeping statements without sufficient evidence or nuance. For example, you claim that "individual actions are more crucial when addressing climate change" without considering the role of governments or industries. The example of "every single Australian" picking up rubbish is an oversimplification of complex environmental issues.

c. Exemplar: "While individual actions alone may not solve climate change, they play a crucial role in addressing environmental issues. For instance, if even half of all Australians committed to picking up one piece of rubbish daily, it would result in over 13 million pieces of waste being properly disposed of each day, significantly reducing pollution in our communities."

#3 (Fourth paragraph): a. Strengths:

- Attempts to link individual actions to broader corporate responsibility
- Recognises the interconnectedness of individuals and organisations

b. Weaknesses: Logical Fallacy Your argument that "corporations are made up of individuals" oversimplifies the complex relationship between individual actions and corporate behaviour. This reasoning falls into the fallacy of composition, assuming that what is true of the parts must be true of the whole. Corporate decisions are influenced by numerous factors beyond individual employees' personal environmental views.

c. Exemplar: "While corporations are indeed composed of individuals, their environmental impact is often driven by complex factors such as profit motives, industry regulations, and market pressures. However, individuals within these organisations can influence corporate policies through advocacy, ethical consumerism, and choosing to work for environmentally responsible companies."

Actionable task: Rewrite the first paragraph, focusing on creating a clear thesis statement that outlines your main argument about the importance of individual actions in addressing environmental issues. Ensure this thesis guides the rest of your essay.

Overall score: 38/50

Section 2: Revision Guidelines

(You are going for a morning stroll and beside you are people from the community picking up rubbish and planting trees in their backyard. Sadly, most places in this area do not look like this. Instead, you see people littering and smoking. But there are some people out there who really care for our environment and want to protect it while others are destroying it. That is why our individual actions need to change to sustain our healthy planet.) #1

Currently, there are many individuals who have done small things to help save our environment. Some include planting more trees, and [as well as] volunteering to pick up rubbish, or using renewable energy. These small actions can still contribute to a cleaner planet.

Firstly, I believe that individual actions are more crucial when addressing climate change because some small actions that individuals do can still contribute to saving the planet. For example, people can pick up some rubbish, use renewable energy and plant some trees. If multiple people can do this, they will contribute to a healthier planet. Imagine if every single Australian picked up a piece of rubbish every day? That would be over 26 million pieces of rubbish picked up every day and disposed of properly. Our world is made up of many individuals, and we can all make a significant difference if we work together. #2

Secondly, it is imperative that individual actions are more crucial when addressing climate change because the corporations are made up of individuals. If the individuals change, then will [so will] the corporations ~~because corporations are made up of individuals~~. Without individuals, there wouldn't even be any companies. #3

To conclude, it is vitally important that individual actions are more crucial when addressing climate change because small actions can make a big difference and corporations are made up of individuals. If you are an individual that wants to help our environment [environment], plant a tree, or pick up some rubbish, because remember that one small action can lead to a great outcome on our planet.
