The Amazing Stellar Laser Cannon

By Walter Samuel Lawson

The Lolans have just invented a stellar laser cannon. This is because there are aliens that are about to invade Earth. A month ago, the National Aeronautics and Space Administration's Voyager 1 discovered flying saucers that appear somewhat predominantly green and blue and green in colour. Voyager 1 detected a lot of flying saucers heading towards Earth. Some of which are also seen with dangerous rocket-propelled grenades and short-range laser cannons. Speed cameras detected that it would arrive at Earth within a fortnight. The National Aeronautics and Space Administration alerted world militaries and government agencies to put their wars on hold and to work together to produce ideas to obliterate the flying saucer fleet.

"It must be fake news. I do not believe in extraterrestrial life or UFO sightings," one leader firmly stated. "NASA should be sued."

Another leader stated, "We should trust NASA. They are a legitimate government agency of the United States."

Most government officials of the United Nations trusted NASA, and because of democracy, all the United Nations members gathered in a conference room in New York City.

"As we all know, there will be aliens invading our planet within a fortnight," hollered Bill Nelson in a megaphone, the chief executive officer of the National Aeronautics and Space Administration, to make sure the back row can hear him.

"Boo!" exclaimed a huge crowd of audibly unwilling members.

Bill Nelson presented his photographic evidence on a projector. The coordinates are: 15h 26m 5.33S, -18° 18' 50.1"

"It is Photoshopped!" a crowd laughed wickedly.

Throughout the meeting, Nelson was disgraced by some government officials. Nelson does not want the rest of the conference to be recorded in the press.

The countries that did not agree with Nelson's "philosophy" agreed to try to disprove him by building a space probe to try to find the mysterious alien ship. They launched the probe and found the alien ships. With their own proof of Nelson's "philosophy", they sent their smartest scientists to join the weapon designing lab.

A German science content creator proposed the idea of a stellar laser cannon after his video about a hypothetical scenario of aliens invading Earth. Everybody liked that idea, so everybody started planning and building his idea. A NASA employee who learnt from Katherine Johnson found the function of how to land the stellar laser using a graphing calculator. Laser manufacturers made an online to-scale 3D model of the laser. Within a week, the portable laser had been created.

The portable laser was then launched and accelerated to 99.999999996 percent of the speed of light. Eight minutes later, the laser was activated directly at the aliens. In two seconds, the alien ships were cooked (literally and figuratively).
