

Greetings fellow students I am Larry from the year 2060. Have you ever thought what will happen to our planet if we do not recycle? I have witnessed the dramatic changes that the world has undergone with its major technological advancements and the detrimental climate change this has caused. Today I am here to explain why recycling is important and the critical role we need to play to protect our home planet Earth.

Recycling is not just about disposing plastic and paper waste into yellow bins. But it is about the magic that happens where your old, used items are transformed into brand new items such as your new book, printing papers and plastic drink bottles. This is why recycling not only helps the planet but we can also take part in this exciting journey.

Recycling has many significant benefits to our planet. It reduces waste, green house emissions and protects the environment. By recycling, it means that less waste will be sent to the landfills. These wastes will also not end up in the ocean killing our marine animals, which has devastating impact on our ecosystem. Re-using the recycled items means that there will be less greenhouse gas emissions as the items will be re-used and new, raw material will not be required to be extracted and processed. This will allow for a much cleaner and protected environment.

It is imperative that we take an active part in recycling both at school and at home. There should be signs and special recycling programs to engage all members in the school to participate in the mission to recycle. The government should also encourage every household to recycle, running campaigns to promote the benefit of recycling and also providing incentives.

To protect our environment for the current and future generations, we must act now and recycle all items which can be recycled. We must take action quick before it is too late!
