

Persuasive Speech

I come to you from the year 2060, a time that's not so far away from your present moment. I'm here to talk to you about something that affects all of us. Something that will shape the world you'll leave behind: the health of our planet.

I know that in the 1980s, things might seem like they're moving fast, and in many ways, you're at the starting line of an exciting technological era. But here's the thing, you're also living in a critical moment. The choices you make today, how you treat the earth, the way you use resources, will determine the world we all live in, in just a few decades.

One of the most powerful ways you can protect the planet is through recycling. I know it may seem small, even insignificant at times. But recycling isn't just about separating plastics or cans—it's about creating a mindset that values our resources, that thinks twice before throwing things away. Imagine if everyone took responsibility for the waste they create—it would reduce pollution, save energy, and keep our land and oceans clean for future generations.

I'm sure you've heard about the effects of climate change. In the year 2060, it's impossible to ignore. Extreme weather, rising sea levels, and natural disasters are part of our everyday reality. The planet is suffering, and it's no longer a distant problem—it's here, now. But here's the good news: it's not too late. Every action we take—whether it's recycling, conserving energy, or supporting sustainable businesses—can make a huge difference.

Living sustainably isn't just about saving the environment; it's about making sure the world you live in, and the world your children inherit, is worth living in. You have the power to influence the future, and that starts with small steps today.

So, I urge you, in the 1980s, to take this seriously. Change is possible, but it requires you—the people of now—to care, to act and to lead the way. Let's start protecting what's ours—before it's too late.
