

## Section 1:

#1 "Firstly, 94.6% of the population do not have solar panels or any type of solar energy. We can decrease this percentage by working together and using solar panels in our area. Recently our family got solar panels on our house because we want to live a sustainable lifestyle. Solar panels create more than 50% of the house's electricity. Imagine every house, apartment and other homes use solar panels, it would deplete climate change by 50%. That's a lot for just one energy, don't you think?"

Strengths: You've included a personal example about your family installing solar panels, which makes your argument more relatable. You've also used statistics to support your point.

Vague claim → Your statement that solar panels would "deplete climate change by 50%" needs more explanation. You've made a significant claim without showing how you arrived at this figure. This weakens your argument because readers might question its accuracy.

***Imagine if every house, apartment and other home used solar panels - this could reduce our carbon emissions significantly. Studies show that residential solar power can cut a household's carbon footprint by up to 80% in sunny regions.***

#2 "Secondly, I want to talk about plastic, the number two cause of climate change. It's just one idea so I can believe that we can get rid of it. If we get rid of it, the benefits are astronomical like the world will be as clean as a hound's tooth, no litter, no mass extinction of species and even more! But the way to do this is if you buy plastic ALWAYS RECYCLE IT and just don't buy plastic resources. "Plastic is just a one-time use, don't cover it on our infinite use Earth," A quote by Abhijeet Pol."

Strengths: You've included a creative quote to emphasise your point. You've also offered practical solutions like recycling.

Underdeveloped ideas → Your paragraph introduces plastic as "the number two cause of climate change" but doesn't explain how plastic contributes to climate change. You jump straight to solutions without helping readers understand the problem clearly.

***Plastic contributes to climate change throughout its lifecycle. When plastic is produced, it releases greenhouse gases. Even when disposed of, plastic continues to release methane and other greenhouse gases as it breaks down. That's why reducing, reusing and recycling plastic is crucial for our planet's health.***

#3 "Subsequently, we need to stop using non-renewable energy, ditch the plastic and use smarter ways to get around the world. This all would lead to a wayyy better life for younger generations. So stand with me "We shall collect the rubbish, we shall install solar panels, we shall not use plastic..."

Strengths: Your conclusion has a passionate call to action that shows your commitment to environmental change.

Lack of specificity → Your conclusion uses informal language ("wayyy better") and makes broad statements without specific details about how these actions will benefit future generations. This makes your argument less convincing.

***Taking these actions now will ensure cleaner air, more stable weather patterns, and healthier ecosystems for future generations. By reducing carbon emissions and plastic pollution today, we're protecting the world our children and grandchildren will inherit tomorrow.***

■ Your piece shows genuine passion for environmental issues, which is its greatest strength. You've touched on several important aspects of climate change, including renewable energy, plastic pollution, and transportation. However, your writing would benefit from more detailed explanations of how these factors contribute to climate change. For instance, when discussing plastic, explain the connection between plastic production and greenhouse gas emissions. Also, try to provide more specific evidence to support your claims. When you mention statistics like "94.6%", include where this information comes from. Additionally, consider organising your ideas more clearly by using topic sentences that preview the main point of each paragraph. Your writing uses creative language, but sometimes the informal tone ("wayyy better") might make your argument seem less serious. Try to maintain a consistent, persuasive tone throughout your piece.

Section 2:

Good morning, Peers and teachersClimate change should be stopped!

By Abhijeet Pol

Did You know that Fossil fuels and non-renewable energy lead to climate change? Well, it does, so we need to stop using these shameful energies and use renewable energy like biothermal, Geothermal, Windmills and more! Ways we could do this at our home are installing solar panels, using biomass to heat our homes, install tiny wind turbines and reuse plastic. Also use renewable transportation.

#1 Firstly, 94.6% of the population do not have solar panels or any type of solar energy. We can decrease this percentage by working together and using solar panels in our area. Recently our family got solar panels on our house because we want to live a sustainable lifestyle. Solar panels create more than 50% of the house's electricity. ~~Imagine every house, apartment and other homes use solar panels, it would deplete climate change by 50%.~~ [Imagine if every house, apartment and other home used solar

panels - this could reduce greenhouse gas emissions significantly.] That's a lot for just one energy, don't you think?

~~#2 Secondly, I want to talk about plastic, the number two cause of climate change. It's just one idea so I can believe that we can get rid of it.~~ [Secondly, I want to discuss how plastic contributes significantly to climate change. Though it seems like a massive challenge, I believe we can address this issue.] If we get rid of it, the benefits are astronomical like the world will be as clean as a hound's tooth, no litter, no mass extinction of species and even more! But the way to do this is if you buy plastic ALWAYS RECYCLE IT and just don't buy plastic resources. "Plastic is just a one-time use, don't cover it on our infinite use Earth," A quote by Abhijeet Pol.

Finally, having to see smoke or gas leaks from multiple vehicles could make you feel pity for the carbon footprint, but we can change that. To change that we need a plan, maybe sometimes when you are going to school in one car you could call your friends over and carpool, we could also use solar panels on vehicles like electric cars, metro and even planes. Fuel, just FUEL, well fuel is a major antagonist to the world; to make fuel we need factories and to fuel factories we need non-renewable energy. So we need to use electric cars, if we all use electric cars the Earth would be shining like never before.

~~#3 Subsequently, we need to stop using non-renewable energy, ditch the plastic and use smarter ways to get around the world. This all would lead to a wayyy better life for younger generations.~~ [In conclusion, we must transition away from non-renewable energy, reduce plastic consumption and develop more sustainable transportation options. These changes will create a significantly better world for future generations.] So stand with me "We shall collect the rubbish, we shall install solar panels, we shall not use plastic..."
